# **Upgrading to Proview V4.7.1**

This document describes new functions i Proview V4.7.1, and how to upgrade a project from V4.7.0 to V4.7.1.

# **New functions**

### Web interface

- Language support is added to the Web interface.
- Method buttons in object graph added.
- Object graphs updated.

### Velleman K8055 experiment board

Velleman K8055 is an USB experiment board with 2 Ai, 5 Di, 8 Do and 2 Ao. It is can be purchased as a kit, K8055, or as an assembled board, VM110. The card can be used to test Proview with some simple application.

The board is configured with the objects USB\_Agent, Velleman\_K8055 and K8055\_Board. See Guide to I/O System for more info.

### **Operator log**

Operator actions can be logged to file.

The logging is started with the xtt command 'oplog start' and the default log file is \$pwrp\_log/xtt.log. The logging is stopped with the command 'oplog stop'.

A log file can be played, i.e. all actions in the file are executed, with the command 'oplog play'.

### Xtt commands

### oplog

New command to handle operator log.

xtt> oplog start [/file=]xtt> oplog stopStart the logging.Stop the logging.

xtt> oplog play [/file=] [/speed=] Execute logged actions.

### Embedded Linux

Support to build Proview for embedded Linux with cross compilation is added to V4.7.1. See Appendix A.

### ARM architecture

Build files for ARM are added to the runtime module. To build for ARM see Appendix A.

### Mac OS X

Proview can be built on Mac OS X on x86\_64 by using and fink. Build with pwre by setting Hardware to x86\_64 and OS macos.

The Mac version is untested and unsupported.

# **New Classes**

#### **GPIO**

I/O Rack object configuring GPIO, General Purpos I/O.

### **GPIO Module**

I/O Card object configuring GPIO.

### **OneWire**

I/O Rack object configuring the Maxim 1-wire bus.

### Maxim\_DS18B20

I/O object configuring the Maxim DS18B20 temperature sensor on the 1-wire bus.

### **USB\_Agent**

I/O Agent object initializing libusb for attachment of USB devices.

### Velleman K8055

I/O Rack object for Velleman K8055 experiment board.

## Velleman\_K8055\_Board

I/O Card object for Velleman K8055 experiment board.

# **Modified Classes**

### ABB\_ACS\_PPO5

A number of attributes removed removed that was used for the old GMS operator place and not

# **Upgrade procedure**

The upgrading has to be done from any version in the interval V4.7.0. If the project has a lower version, the upgrade has to be performed stepwise following the schema

```
V2.1 -> V2.7b -> V3.3 -> V3.4b -> V4.0.0 -> V4.1.3 -> V4.2.0-> V4.5.0-> V4.6.0-> V4.7.0-> V4.7.1
```

The upgrade procedure is to dump the database with reload.sh, change the version of the project in the projectlist, and then execute the script upgrade.sh.

#### NOTE!!

Do not activate Update Classes.

If the previous version should be kept, first make a copy of the project.

# Make a copy of the project

Do sdf to the project and start the administrator

> pwra

Now the Projectlist is opened. Enter edit mode, login as administrator if you lack access. Find the current project and select Copy Project from the popup menu of the ProjectReg object. Open the copy and assign a suitable project name and path. Save and close the administrator.

## Dump the databases

Execute the first pass, dumpdb, in the script reload.sh.

```
> reload.sh
```

```
reload.sh Dump and reload of database.
```

Arguments Database or databases to reload.

I no arguments is supplied, all databases will be

reloaded.

#### Pass

dump db	Dump database to toutfile Course db/Isrelymet sh dmp
dumpdb	<pre>Dump database to textfile \$pwrp_db/'volume'.wb_dmp</pre>
classvolumes	Create structfiles and loadfiles for classvolumes
renamedb	Rename the old database
dirvolume	Load directory volume
loaddb	Load the dump into the new database
compile	Compile all plcprograms in the database
createload	Create new loadfiles.

createboot Create bootfiles for all nodes in the project.

```
-- Reloading volume directory volopg2
Pass: dumpdb classvolumes renamedb dirvolume loaddb compile createload
createboot
Enter start pass [dumpdb] >
               ______
Pass dump database
______
Do you want to continue ? [y/n/qo] y
ls: cannot access /data0/pwrp/opg2/common/db/*.wb dmp: No such file or
Dumping volume directory in /data0/pwrp/opg2/common/db/directory.wb dmp
I Database opened /data0/pwrp/opg2/common/db/volopg2.db
ls: cannot access /data0/pwrp/opg2/common/db/*.wb load: No such file or
directory
Pass create structfiles and loadfiles for classvolumes
Do you want to continue ? [y/n/go] n
setdb is obsolete
```

Check that the one dumpfile is create for the directory volume and one for every other rootvolume

```
> cd $pwrp_db
> ls -l *.wb_dmp
-rw-rw-r-- 1 cs pwrp 1771 2010-03-26 16:32 directory.wb_dmp
-rw-rw-r-- 1 cs pwrp 7467 2010-03-26 16:32 volopg2.wb dmp
```

### Linux release upgrade

If you are using Ubuntu 9.4 or Fedora 10 you need to upgrade the linux release and install the pwr47 package.

## Change version

Enter the administrator and change the version of the project to V4.7.1. Save and close the administrator.

# upgrade.sh

Do sdf to the project.

upgrade.sh is a script that is divided into a number of passes. After each pass you you have to

answere whether to continue with the next pass or not. Start the script with

```
> upgrade.sh
```

Start from the classvolumes pass.

```
Enter start pass [classvolumes] >
```

#### classvolumes

Create loadfiles and structfiles for the class volumes.

#### renamedb

Store the old databases under the name \$pwrp db/'volumename'.db.1.

### cnvdump

Converts values of Profibus module objects.

#### loaddb

Create databases and load the dumpfiles into them.

#### compile

Compile all the plc programs.

#### createload

Create loadfiles for the root volumes.

#### createboot

Create bootfiles for all nodes in the project.

If the project contains any application programs, these has to be built manually.

Delete files from the upgrading procedure:

```
$pwrp_db/*.wb_dmp.*
$pwrp_db/*.db.1 (old databases, directories which content also should be removed)
```

### List example

```
> sdf opg2
Setting base /data0/x4-7-1/rls
bash: cd: /data0/pwrp/opg2/src/login: No such file or directory
> upgrade.sh
upgrade.sh Upgrade from V4.7.0 to V4.7.1
```

Pass

```
classvolumes
                 Create loadfiles for classvolumes.
   renamedb
                 Rename old databases.
   loaddb
                 Load dumpfiles.
   Cnvdump
                 Convert the dumpfiles.
   compile
                 Compile all plcprograms in the database
   createload
createboot
                 Create new loadfiles.
   createboot
                 Create bootfiles for all nodes in the project.
-- Upgrade opg2
Enter start pass [classvolumes] >
Pass create structfiles and loadfiles for classvolumes
Do you want to continue ? [y/n/go] y

# Appendix A Embedded Linux

Proview is adapted to be built for embedded Linux systems with cross compilation in a Linux host environment.

First the Proview runtime module of the base system has to be built, and then a project is created where also the plc executable is built with cross compilation. The following example will describe a build for the ARM architecture with the cross compilation tools arm-linux-gnueabi-gcc, arm-linux-gnueabi-g++ and arm-linux-gnueabi-ar.

The runtime module build is dependent on an development installation or a complete build on the host system. Platform independent files as loadfiles and java archives are copied from the host release to the embedded build tree, also build tools in the host release are used to perform the build.

Environment variables defining the cross compilation tools, and the path to the exe directory of the host release has to be defined before starting the build.

```
export pwre_cc=arm-linux-gnueabi-gcc
export pwre_cxx=arm-linux-gnueabi-g++
export pwre_ar=arm-linux-gnueabi-ar
export pwre_host_exe=/usr/pwr47/os_linux/hw_x86/exp/exe
```

The tool to build Proview from sources, pwre, also has to be initialized

```
export pwre_env_db=~/pwre_env_db
export pwre_bin=~/pwrsrc_4.7.1/src/tools/pwre/src/os_linux
source $pwre bin/pwre function
```

Follow the Build from sources guide to build from the source code with the following modifications.

When adding the pwre environment, state the import root to the hw directory of the host release

```
Import root: /usr/pwr47/os_linux/hw_x86 and set hardware to arm.
```

Hardware: arm

```
> pwre add armx471
Source root []? /home/pwrd/pwrsrc_4.7.1/src
Import root []? /usr/pwr47/os_linux/hw_x86
Build root []? /home/pwrd/pwrrls_4.7.1
Build type [dbg]?
OS [linux]?
Hardware []? arm
Description []? X4.7.1 for ARM
```

Initialize the arm environment

```
> pwre init armx471
Create the build tree
```

- > pwre create\_all\_modules Import files from the import release
- > pwre import rt

If the java archives are to be a part of the release these can be imported with the command

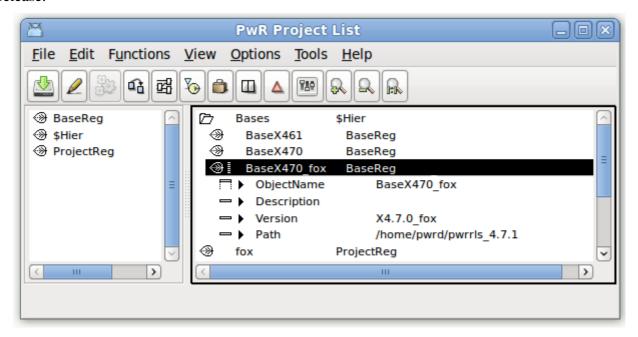

> pwre import java

Build the runtime module. If you want to customize the build you can choose what additional modules you want to build in the file \$pwre\_bin/ebuild.dat

> pwre ebuild rt

When the build is performed, create the /usr/pwrrt/exe, /usr/pwrrt/load directories in the embedded file system and copy the rt\_ files to the exe directory, and .dbs -files to load directory.

Define the embedded release in the project list with a BaseReg object and insert to path to the release.

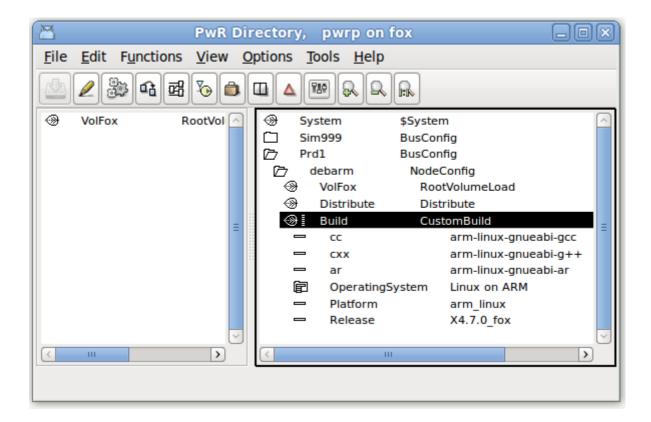

# **Project**

The project is created and developed and simulated in the host release environment.

Set the OperatingSystem of the NodeConfig object for the embedded node in the directory volume to CustomBuild.

Create CustomBuild object below the NodeConfig object, that points out the embedded release and platform, and that defines the embedded toolchain.

The CustomBuild object will create a script, \$pwp\_exe/custom\_build.sh that sets up the embedded build environment. If you need to make additional changes you can remove CustomBuild object and insert the changes in custom\_build.sh.

### Installing Proview

The following directories should be created in the root files system and the following files should be copied to them.

#### **Proview runtime**

#### /etc

Copied from \$pwre\_croot/src/tools/bld/pkg/deb/pwrrt

pwrp\_profile
proview.cnf

#### /usr/pwrp/adm/db/

Copied from \$pwra\_db

pwr user2.dat

#### /usr/pwrrt/exe

Copied from \$pwr\_exe (/home/pwrd/pwrrls\_4.7.1/os\_linux/hw\_arm/rt/exe)

```
pwr_pkg.sh
pwr_stop.sh
rs_remote_3964r
rs_remote_logg
rs_remote_modbus
```

```
rs remote serial
rs_remote_tcpip
rs remotehandler
rt alimserver
rt bck
rt emon
rt fast
rt ini
rt neth
rt neth acp
rt print.sh
rt prio
rt qmon
rt rtt
rt sevhistmon
rt statussrv
rt sysmon
rt tmon
rt trend
rt webmon.sh
rt webmonelog.sh
rt webmonmh.sh
```

### /usr/pwrrt/load

Copied from \$pwr\_load

abb.dbs basecomponent.dbs inor.dbs klocknermoeller.dbs nmps.dbs opc.dbs otherio.dbs othermanufacturer.dbs profibus.dbs pwrb.dbs pwrs.dbs remote.dbs rt.dbs siemens.dbs ssabox.dbs telemecanique.dbs tlog.dbs wb.dbs

### /usr/pwrrt/lib

Copied from \$pwr\_lib

pwr\_beans.jar
pwr\_jop.jar
pwr\_jopc.jar
pwr rt.jar

```
pwr rt client.jar
```

### **Project**

### /pwrp/common/load

```
Copy from $pwrp_load
```

```
Loadfile ('rootvolumename'.dbs)

ld_node file (ld_node_'nodename'_'busid'.dat)

ld_boot file (ld_boot_'nodename'_'busid'.dat)

ld_appl file (ld_appl_'nodename'_'busid'.txt)

flow-files (.flw)

crossreference files (rtt crr* 'volumeid'.dat)
```

#### /pwrp/common/log

Create only this directory if you want a log-file for system messages. Note that this might wear out you flash memory.

```
/var/www
```

```
Copy from $pwrp_web

*.html
pwrp_'nodename'_web.jar

Copy from $pwr_lib

pwr_rt_client.jar

pwr_jop.jar

pwr_jopc.jar

/pwrp/arm_linux/exe

Copy from $pwrp_root/bld/arm_linux/exe

Plc executable (plc_'nodename'_'busid'_'version')

xtt help.dat
```

# Settings

Set the Qcom busid in /etc/proview.cnf, parameter qcomBusId.

Execute /etc/pwrp\_profile in .bashrc for the root user

```
source /etc/pwrp profile
```

Add startup-file for Proview in for example /etc/init.d. Copy from

```
$pwre croot/src/tools/pkg/deb/pwrrt/pwr
```

### Distribute

The distributor can be use to copy files to a running system. For single user system add the username to the bootnode in the NodeConfig object, e.g. root@mynode.
